## Q Series

### How to Program Q Series Cruise Mode

Cruise mode refers to a steady on feature, usually set at about 10% programmed to any color on both your Q or V series. I'm gonna show you how that's programmed on our Q Series light head. I'll begin by hooking up my mode wire. When I do that, the light will flash in a blue pattern, which is my factory default. I'll grab my blue wire and tap that to ground. I'm searching for the steady on 10% intensity pattern. It's towards the end. I'll keep tapping. And there it is. The majority of all cruise mode application is going to be steady on 10%. I could now cycle the color to a different color. If I desire that green to power changes the color. I have 5 available colors to pick from, and there you have it. It's as simple as that to program cruise mode on any of your 3 available modes.
